

*Four & Twenty blackbirds:
A dainty dish for a king,
but not for your aircraft*

**Get "The Point" to keep
those nasty birds away**

In Mother Goose's world, the five million blackbirds in the U.S. would all sing in a pie for a king.

In reality, they find every small plane they can and stake a claim.

They nest in engines. They leave acidic droppings everywhere. And as all pilots know, aerodynamics suffer if paint jobs aren't constantly cleaned.

Owl and snake decoys and the like have provided only limited relief in shooing away these pesky creatures.

Until now.

"The Point" is the new simple solution to what has been a surprisingly difficult problem.

Upon landing, simply mount one of the easy-to-install devices on your aircraft's propeller, another on the tail. The result: "The Point's" staggered V-pattern of metal safety needles easily keeps the birds away.

And when blackbirds can't land on the two prime spots they use to mark aircraft for nesting, they go find easier pickings.

It's just \$59 for one, \$99 for two.

Get "The Point"? If you don't, your feathered friends sure won't.
